Elite Workout Manual

Chapter 7 – Nutrition Blueprint

Objective

Support body recomposition by maximizing muscle gain, recovery, and performance while minimizing unnecessary fat gain.

Category	Recommendation
Calories	Start near estimated maintenance (+/-100 kcal). Adjust every 2–3 weeks based on weight,
Protein	110–140 g/day (target ~130 g). Spread across 3–5 meals.
Fat	55–70 g/day from healthy sources.
Carbohydrates	Fill the remaining calories. Emphasize around training.
Water	3–3.5 L/day minimum.

Meal Timing

Pre-workout (30–60 min): Water + optional black coffee + easily digested carbohydrate if hungry.
Post-workout (within ~2 hours): Protein-rich meal plus carbohydrates.
Evening: Balanced meal with protein to support recovery.

Protein Sources

Chicken, eggs, fish, prawns, lean meat, milk, yogurt, paneer (if tolerated), soy products if desired. Aim to include a quality protein source at every meal.

Foods to Limit

Ultra-processed snacks, sugary drinks, and frequent junk food. Use an 80–90% nutritious food approach rather than trying to eat perfectly.

Supplements

None are required. If diet alone cannot meet protein needs, food choices should be improved first. Creatine monohydrate can be considered later if desired and medically appropriate.

Progress Checks

Review body weight (weekly average), waist measurement, gym performance, hunger, energy, and recovery every 2–4 weeks before changing calories.

Coach's Notes

Your current protein intake (30–50 g/day) is the biggest nutritional limitation. Increasing protein while maintaining consistent training will likely have a larger impact than searching for advanced supplements.
